

Business-ready AI agents need a trust layer.

ReiOps turns raw agents into managed workflows with secure sandboxes, approval gates, live traces, audit logs, and Telegram operator control.

Live demo: reiops.xyz/demo

The problem: agents are cheap, trust is scarce.

Businesses do not lack access to AI agents. They lack safe operational control.

Raw agents get broad access

Scripts, CLIs, and chatbots often need credentials, repositories, internal tools, and customer data before teams can see value.

No reliable audit trail

When something changes, teams need to know what happened, which tools ran, what files changed, and who approved it.

No business owner for failure

SMBs and enterprises want outcomes, support, permissions, and accountability — not another ungoverned automation stack.

The shift

Old question

“Can an agent do the task?”

New question

“Can a business safely trust it?”

ReiOps packages agents as managed workflows.

A control plane + managed marketplace for business-ready AI agents.

GTM wedge: start as a tech-enabled service, productize repeatable deployments into a managed agent workflow marketplace.

Live demo: GitHub Issue Fixer.

A familiar workflow that shows sandboxing, traces, approvals, and auditability.

-  **Input** GitHub Issue #128: flaky login timeout test
-  **Execution** Agent inspects code, edits files, runs tests
-  **Policy** Touches auth/session logic → PR creation blocked
-  **Approval** Human approves from web dashboard or Telegram
-  **Output** PR result + trace stored as audit trail

This is a simulated public demo — no production repository is modified.

Why now: agent supply is exploding.

The adoption bottleneck moves from model capability to business trust and operations.

Open-source agents

Every team will have access to capable agent frameworks and coding assistants.

Tool access grows

Agents increasingly connect to repos, SaaS apps, CRMs, infra, and internal data.

Business risk grows

More capability means more need for permissions, approvals, logs, cost controls, and support.

ReiOps is not betting that one agent wins.

We are betting that every business needs a trusted layer to run many agents safely.

Business model: managed workflows first, platform second.

Start close to customers; productize what repeats.

SMB managed workflows

Monthly managed packages for common workflows: issue fixing, support drafts, research, invoices, internal ops.

Enterprise deployments

Custom agent workflows with sandbox profiles, policy gates, audit logs, integrations, support, and SLA.

Marketplace take rate

Long-term curated distribution layer where vetted builders publish business-ready workflows on ReiOps.

Service learning

Repeatable templates

Control plane

Marketplace

Team: technical builder + operations credibility.

A family team combining agent system building with real-world infrastructure operations.

Vsevolod Malakhov

Technical founder

18-year-old Information Systems student at OmsU. Built Rei, a Telegram-first internal agent operating system, and previously built OpenKey, an end-to-end encrypted messenger. Focus: distributed systems, security, agent orchestration, and human-in-the-loop interfaces.

Vadim Solovev

Operations / business lead

15+ years across critical infrastructure, construction, consulting, and data center operations. Brings enterprise process design, budgets, stakeholder management, and real-world operational discipline.

Proof today: live domain + Telegram bot + public demo repo + working web/API/bot deployment.

What we are building next.

From prototype to design partners and repeatable managed workflows.

1 Design partners Run controlled workflows with small teams that need safe automation.

2 Real integrations GitHub first, then support, sales research, and internal ops workflows.

3 Policy engine Configurable permissions, risky-action detection, approval roles, audit export.

4 Managed marketplace Turn repeated deployments into curated business-ready agent workflows.

ReiOps: trusted distribution and operations layer for business-ready AI agents.
